# Technical Program

Monday, January 25

Monday, January 25 10:40 - 12:40 (Asia/Tokyo)

## 1A2: Workshop 1: Post processing techniques in 5G, Automotive & Space antenna measurements

**Speakers: Dr. Lars Jacob Foged (Microwave Vision Group), Prof. Dr. Manuel Sierra-Castañer (Technical University of Madrid)**

### Abstract

This course is a fast pace introduction to modern applications of post-processing techniques to exploit the antenna measurement results. Nowadays, the use of information from antenna under test, antenna measurement system and electromagnetic measurements results allow the improvement of those results for:

- Extraction of electromagnetic sources in the antenna surface.
- Detection of errors in antenna design.
- Improving measurement results cancelling echoes, leakage, noise...
- Extrapolating the radiation pattern to unmeasured angles.
- Combination of measurements and simulations to emulate the effect of the environment.

Following a brief introduction to near and far field antenna measurements theory, the course will focus on these techniques. The second part of the course will be the explanation of the following techniques:

- Time gating techniques.
- Extraction of Equivalent sources through inverse electromagnetic problems.
- Use of holographic techniques for extracting equivalent currents on a surface.
- Filtering of measurement results using spherical or cylindrical near field modes expansion.

The third session will deal with different applications of those techniques. In this section, applications for BTS antennas, automotive measurement, RADAR systems, satellite antennas will be shown. The course outline is:

- Theory and application of far-field and near field antenna measurements
- Equivalent currents using integral equation and holographic techniques.
- Time domain and time gating techniques.
- Spherical and Cylindrical modes expansion and filtering of spurious signals.
- Application in telecom, satellite, automotive and defense measurement scenarios.

## 1B2: Workshop 2: Passive human detection, localization, and posture identification, using radio technologies

**Speakers: Assistant Prof. Dr. Yang Miao (Twente University, the Netherlands), Prof. Dr. Minseok Kim (Niigata University, Japan), Prof. Dr. Jörg Schäfer (Frankfurt University of Applied Sciences, Germany), Prof. Dr. Stefano Savazzi (Consiglio Nazionale delle Ricerche (CNR), Italy)**

### Abstract

This workshop is to address one of the most challenging issues in wireless radio based assisted living, i.e., to dynamically detect, localize and track, and identify the postures of multiple humans in indoor environment. As Japanese, Europeans, etc., are growing older and healthier, these societies face tremendous challenges in securing the future wellness of a larger segment of its population requiring special attentions, e.g., the elderly and the physically impaired. This is expected to have a great impact on the future advancement of these societies. The emerging wireless technologies are enablers that can be applied to solve many of the wellness challenges, e.g., through the clever combination of wireless radio and smart buildings. Moreover, radio systems are less sensitive to visibility conditions to operate appropriately. Therefore, they naturally mitigate possible privacy concerns that may arise as compared to the camera- or the visible light-based systems where people are "observed" directly through image data or under visible conditions. The wireless radio-based assisted living can be achieved through the passive detection, the localization and the posture identification of humans. Here "passive" indicates that the assisted individual needs not to wear or carry any additional devices, i.e. "device-free". The existing passive systems employ the time of arrival, the angle of arrival, the received signal strength (RSS), the complex channel state information of radio waves to perform localization. For example, fingerprinting, a localization technique based on RSS measurements, consists of an offline phase to build a database from surveyed signals at known positions. The process is labour intensive and is not robust against changes in physical environment. Alternatively, in multiple-input multiple-output (MIMO) systems, antenna arrays with many elements provide sufficient spatial resolution to discern signals coming from different directions, while wideband provide delay resolution to separate multiple copies of these signals in time. The temporal-spatial-delay domain profiles contain information on human form-factors as well as on surrounding objects. However, it is challenging to sort out human-relevant information.

## 1C2: Workshop 3: Advancements in 5G Antennas and Emerging 6G Antenna Technologies

**Speaker: Prof. Dr. Wonbin Hong (Pohang University of Science and Technology, Korea)**

### Abstract

The advent of millimeter-wave and sub-Terahertz for wireless, civilian applications have spurred unprecedented opportunities and challenges within the wireless society. Expanding the technological footprint of millimeter-wave and sub-THz antennas and propagation for Beyond 5G/6G cellular, access and infrastructures are expected to introduce unprecedented challenges. Practical design considerations and potential novel solutions related to the realization of millimeter-wave and sub-

THz antennas with beamforming capabilities are discussed in detail. This workshop attempts to share and discuss the current and emerging challenges surrounding millimeter-wave based 5G antenna systems and the upcoming 6G sub-Terahertz antenna technologies based on realistic considerations and constraints. The workshop will assess the future direction of mobile antennas and RF circuits for high mobility devices such as future smartphones and data terminals using a holistic approach. Afterwards, a series of detailed demonstrations will be discussed.

## 1D2: Workshop 4: The Design of Millimeter-Wave Wideband Multi-Polarization Antenna Array

**Speaker:** Prof. Dr. Ying Liu (Xidian University, China)

**Abstract**

## 1E2: Workshop 5: Circularly Polarized Antennas: Design and Measurement techniques

**Speakers:** Prof. Dr. Takeshi Fukusako (Kumamoto University, Japan)

**Abstract**

Circular polarization is an attractive polarization for many types of wireless telecommunications, such as satellite communication, RFID, etc. There are always strict requirements for circularly polarized (CP) antennas, such as broadband, small size, slim shape of designs, low cross-polarization in a wide radiation range of azimuth, etc. Also, designing CP antennas with such challenging performances are attractive for antenna researchers and designers. In this workshop, some design techniques for such applications and requirements are organized. In addition to this, some measurement techniques for essential parameters in circularly polarized antennas, such as axial ratio, gain measurement, will be summarized. In this opportunity, we would like to think of antennas with a point of view of polarization.
